Project Title: MaatriCare

Abstract

Pregnancy involves regular appointments, daily care, personal records, and communication with healthcare professionals. When information is scattered across separate tools, organizing tasks and preparing for visits can be difficult. MaatriCare is a pregnancy support and care-coordination application that brings these activities into one authenticated workspace.

The system supports pregnancy profiles, appointments and visit questions, daily care and wellbeing tracking, a private symptom journal, milestones, educational resources, healthcare summaries, emergency contacts, and configurable reminders. Users choose which records to include in reports and may share selected reports through revocable, time-limited links. MaatriCare organizes user-entered information; it does not diagnose, recommend treatment, or replace professional or emergency care.

The frontend uses React, TypeScript, and Vite. The backend uses Java Spring Boot REST APIs, Spring Security/JWT, validation, and JPA. MySQL is used locally and PostgreSQL is configured for production. Optional scheduled Web Push uses Asia/Kolkata time and requires VAPID keys and HTTPS for live delivery.

Tools & Technologies Used

Frontend: React, TypeScript, Vite

Backend: Java, Spring Boot REST API

Database: MySQL (local), PostgreSQL configuration

Security: Spring Security, JWT

Approval Committee

Internal Examiner | Deputy Director - CDOE | Director - CDOE
